User Responsibility

This Product will perform in conformity with the description thereof contained in this User’s Reference manual and accompanying labels and/or inserts, when assembled, operated, maintained, and repaired in accordance with the instructions provided. This Product must be checked periodically. A defective Product should not be used. Parts that are broken, missing, plainly worn, distorted, or contaminated should be replaced immediately. Should repair or replacement become necessary, Datex-Ohmeda recommends that a telephonic or written request for service advice be made to the nearest Datex-Ohmeda Customer Service Center. This Product or any of its parts should not be repaired other than in accordance with written instructions provided by Datex-Ohmeda and by Datex-Ohmeda trained personnel. The Product must not be altered without the prior written approval of Datex-Ohmeda. The user of this Product shall have the sole responsibility for any malfunction which results from improper use, faulty maintenance, improper repair, damage, or alteration by anyone other than Datex-Ohmeda.

⚠️ CAUTION U.S. Federal law restricts this device to sale by or on the order of a licensed medical practitioner. Outside the U.S.A., check local laws for any restriction that may apply.

Datex-Ohmeda products have unit serial numbers with coded logic which indicates a product group code, the year of manufacture, and a sequential unit number for identification.

AAA F 12345

This alpha character indicates the year of product manufacture and when the serial number was assigned: “D” = 2000, “E” = 2001, “F” = 2002, etc. “I” and “O” are not used.

S/5 Aespire, Link-25, Disposable Multi Absorber, Reusable Multi Absorber, SmartVent, Tec 6 Plus, and Tec 7 are registered trademarks of Datex-Ohmeda Inc.

Other brand names or product names used in this manual are trademarks or registered trademarks of their respective holders.

1 Introduction

In this section

What is an Aespire 7900? ................................. 1-2
Symbols used in the manual or on the equipment ................. 1-3
What is an Aespire 7900?

The Aespire 7900 is a compact, integrated and intuitive anesthesia delivery system. The ventilator portion provides mechanical ventilation for patients during surgery as well as monitoring and displaying various patient parameters.

The system uses a microprocessor-controlled ventilator with internal monitors, electronic PEEP, Volume Mode, and other optional features. A serial interface permits communication to cardiovascular and respiratory gas monitoring.

Illustrations in this manual may not cover all types of options available. Other equipment may be attached to the system on the top shelf or on the side dovetail rails. Consult with your Datex-Ohmeda representative for details about systems available in your location.

The Aespire 7900 is not suitable for use in an MRI environment.
Symbols used in the manual or on the equipment

⚠️WARNINGS and ⚠️CAUTIONS tell you about dangerous conditions that can occur if you do not follow all instructions in this manual. Read and follow all warnings and cautions.

WARNINGS tell about a condition that can cause injury to the operator or the patient.

CAUTIONS tell about a condition that can cause damage to the equipment.

A Note provides additional information to clarify a statement in text.

An Important statement is similar to a Note, but provides a comment of greater emphasis.

Other symbols replace words on the equipment or in Datex-Ohmeda manuals. No one device or manual uses all of the symbols. These symbols include:

- On (power)
- Off (power)
- Standby
- Standby or preparatory state for part of the equipment
- “ON” only for part of the equipment
- “OFF” only for part of the equipment
- Direct current
- Alternating current
- Protective earth ground
- Earth ground
- Frame or chassis ground
- Alarm silence button
- Equipotential
- Variability
- Variability in steps
- Not autoclavable
- Type B equipment
- Type BF equipment
- Type CF equipment
- Caution, ISO 7000-0434
- Attention, refer to product instructions, IEC 601-1.
- This way is up.
- Dangerous Voltage
- Input
- Output
- Stock Number
- Serial Number
- Bag position/ manual ventilation
- Read top of float
- Vacuum inlet

<td>-------------</td>
</tr>
</tbody>
</table>
| 6    | **Canister release**  
Push to remove the canister. This allows the breathing system to vent to the room. Be sure to hold the canister by the handle before releasing the canister.  
*Note: Always do a leak test after operating the canister release.* |
| 12   | **APL valve**  
Adjusts breathing system pressure limit during manual ventilation. The scale shows approximate pressures. Above 30 cm H₂O, you will feel clicks as the knob turns. Turn clockwise to increase. The following example setting is at about 20 cm H₂O: |
When you operate a breathing apparatus with fresh gas from the ACGO:

- Mechanical ventilation is not available.
- The pressure gauge, Bag/Vent switch, APL valve, and bag arm are not part of the external circuit.
- Volume and pressure monitoring are not available.
- O₂ monitoring of fresh gas is available automatically when the ACGO is selected if the system has the O₂ monitoring option.
- Fresh gas oxygen concentration is displayed on the ventilation screen. Set alarm limits appropriately. Note that fresh gas oxygen concentration may not reflect FiO\textsubscript{2} in rebreathing circuits such as the Mapleson series. Use an external \textit{O}_2 monitor if using a rebreathing circuit on ACGO.
- A sample of the fresh gas is diverted to the \textit{O}_2 cell in the breathing system.
- The sample flow to the \textit{O}_2 sensor is dependent on the pressure in the external circuit. The sample flow reduces the fresh gas flowrate to the external breathing circuit as shown in the graph.
- Do not use an external ventilator on the ACGO.
- Do not use the ACGO to drive external ventilators or for jet ventilation.

Estimate the mean pressure required for ventilation and determine a mean sample flow rate from the graph:

![Graph](image)

\textit{Figure 2-4} • Back pressure (cm H\textsubscript{2}O) vs. flow to \textit{O}_2 sensor (L/min)

**Scavenging the ACGO sample flow**

If the external manual breathing circuit is to be used with N\textsubscript{2}O or volatile anesthetics, the sample flow should be scavenged.

1. Occlude the patient circuit of the breathing system by using the leak test plug located to the rear of the expiratory port.
2. Check for clinically correct settings. Set the Bag to Vent switch to the ventilator mode. Alternatively set the Bag to Vent switch to the bag mode and set the APL to MIN and attach a bag.
3. The bellows, or bag, will fill slowly with the fresh gas sample flow and then spill to the AGSS.
Scavenging from the external manual breathing circuit

If the external manual breathing circuit is to be used with N\textsubscript{2}O or volatile anesthetics, the exhaust should be scavenged.

An auxiliary inlet is available for active AGSS units. It provides a 30 mm male connection into the auxiliary port under the breathing system.

- The auxiliary inlet is a convenience inlet to the air brake of active AGSS units. There is a reservoir to capture exhaust flows higher than the extract flow.

For all AGSS, a separate exhaust hose is necessary from the external manual circuit to the disposal point.

Vaporizer controls

Refer to the description in this section and the vaporizer operation and maintenance manual for more detailed information on the vaporizer.

Figure 2-5 shows the vaporizer controls.

1. Lock Lever
2. Concentration Control and Release
3. Tec 6 Plus
4. Tec 7

*Figure 2-5  •  Vaporizer controls*

<table>

Push the release and turn the concentration control to set the agent concentration. The Tec 6 Plus concentration control does not turn as long as the warm-up indicator is on.
Optional Features

The Aespire 7900 can be equipped with several optional ventilation functions. References made in this manual to SIMV and PSVPro modes, are only applicable to systems equipped with these functions.

Control panel

Ventilator controls include:

- Touch keys
- Menu screens
- A control knob

1. Alarm silence (key)
2. Alarm message (display)
3. Volume alarms On/Off (key)
4. Menu key
5. Breathing circuit module (display)
6. Control knob
7. Control setting
8. Selection key
9. Ventilation mode (display)
10. Ventilator status (On or Off)
11. Mains indicator
12. End Case (key)
13. Measured values

*Figure 2-6  • SmartVent controls and monitored data*

All but two of the controls for the ventilator are located on the Ventilation/Monitoring display. The two controls are:
- The system switch, which powers the ventilator.
- The Bag/Vent switch, which starts and stops mechanical ventilation.

</tbody>
</table>
How to set controls

The bottom of the screen shows control settings.

Notes:
- The ventilator will not allow the setting of values it cannot supply. A reject tone will sound or a message will appear on the screen.
- If the incorrect key is pushed, wait ten seconds or push the correct key.
- If the new setting is not saved, the ventilator continues to use the old setting.

Step 1
Push the selection key below the setting.

Step 2
Turn the knob to change the setting.

Step 3
Push the knob or the key to save the change.
How to use the menu

Screens go back to the normal display 25 seconds after the last action. During a calibration or other procedure, the screen shows the instructions.

**Step 1**
Push the Menu key to see the main menu.

**Step 2**
Turn the knob to select an option (highlight).

**Step 3**
Push the knob to show the next screen.
Menu map  Figure 2-6 shows the menu map. The table tells you about some of the options.

Note: If the Alarm Settings page shows $V_e$ Auto Limits On during mechanical ventilation, the system automatically calculates alarm limits.

Figure 2-7 • Menu map

</table>
How to change menu settings

This example changes alarm limits.
The screen goes back to the normal display 25 seconds after the last action.

**Step 1**
Select the desired menu.

**Step 2**
Turn, then push the knob to select an option.

**Step 3**
Turn the knob to change the setting.

**Step 4**
Push the knob to save the change.
Optional auxiliary $O_2$ flowmeter and suction regulators

These options are available:

- Auxiliary $O_2$ flowmeter
- A continuous suction regulator or a venturi suction regulator

1. Auxiliary $O_2$ Flowmeter outlet
2. Auxiliary $O_2$ Flowmeter
3. Auxiliary $O_2$ flow control

*Figure 2-8 • Optional Auxiliary $O_2$ Flowmeter and control*

1. External vacuum (non-venturi)
2. Collection bottle connection
3. Filter
4. Overflow safety trap

*Figure 2-9 • Optional Suction Regulator*
**Suction regulator controls**

Mode switch:
- **MAX**: for maximum suction, set the switch to **MAX**.
- **On (I)**: for adjustable suction, set the switch to on (I) or (I).
- **Off (0)**: to turn off suction, set the switch to 0.

With the mode switch set to "I", turn the control clockwise to increase suction and counterclockwise to decrease it.

**Auxiliary flowmeter control**

The auxiliary flowmeter is not pressure compensated.

Turn the control counterclockwise to increase the O₂ flow and clockwise to decrease.
3 Operation and Tutorial

⚠️ WARNING ⚠️

In addition to volume apnea and low airway pressure alarms, other ventilator alarms are included to indicate potential hazard conditions. All alarms that occur should be investigated to help ensure adequate patient safety.

⚠️ Desiccated (dehydrated) absorbent material may produce dangerous reactions when exposed to inhalation anesthetics.

⚠️ For systems with dual absorbent canisters, the carbon dioxide absorbent material in both canisters shall be changed at least weekly, preferably every Monday morning. For single canister systems the absorbent material shall be changed every day, preferably at the start of the day.

⚠️ Carbon dioxide absorbent material shall be changed whenever users cannot assure the degree of hydration of the absorbent. Such conditions may include finding a machine with fresh gas that has been flowing for an unknown period of time, or using a machine that is used infrequently.

⚠️ All fresh gas flows shall be terminated when the machine is NOT in use. (User manuals describe how to achieve null flows).

⚠️ Users are advised to consider the use of low-flow techniques when the machine is in use and whenever clinically appropriate to maintain hydration of the absorbent material.
In this section

This section describes specific tasks. Use it as a step-by-step guide or a training tool.

Turn on the system ......................................................... 3-4
Set the alarm loudness .................................................. 3-5

Set the ventilation mode ................................................ 3-16
Set ventilator controls .................................................. 3-18
Set SIMV and PSVPro controls ....................................... 3-24
Silence alarms ............................................................ 3-26
Reading the pressure waveform (Paw) ......................... 3-27
Measure circuit compliance ........................................ 3-30
Show the service settings ............................................. 3-31
Measure circuit compliance ........................................ 3-33
Pre-use check list

Connect the power cord to a wall outlet.

Prior to each case check all the ventilator settings to ensure they are appropriate for the patient.

1. Check that the mains electrical indicator is lighted.
2. Turn on the anesthesia system power switch. (If system power is already ON, cycle the power switch OFF, then back ON to allow the system power-up self test to run.)
3. Unplug the system power cord from mains power.
4. Ensure the ventilator functions and indicates the use of battery backup power.
5. Reconnect the system power cord to the system mains power.
6. Select the desired mode of ventilation.
7. Select the desired breathing circuit and ensure it is displayed to the right of the selected ventilation mode above the pressure waveform.
8. Set the fresh gas flow.
9. Set VT, to the appropriate tidal volume value or Pinspired to the appropriate level.
10. Set the breathing rate.
13. Set PEEP.
14. Check and adjust alarm settings to ensure they are appropriate for the ventilator settings and the case at hand.
15. Run the 21% Oxygen Sensor Calibration Check.
**Turn On the system**

**Step 1**
Connect the power cord to a wall outlet. The mains indicator comes on when AC Power is connected.

**Step 2**
Set the system switch to On (I).

**Step 3**
The display shows the power-up screen, and the system does a series of self tests.

**Step 4**
When the self tests pass, the display shows the normal screen.
If a test fails, the screen shows an alarm.
Refer to the troubleshooting section.
**Set the alarm loudness**

**Step 1**
Select the Screen and Audio Setup menu.
- Push the menu key.
- Turn, then push the knob to select Screen and Audio.

**Step 2**
Turn, then push the knob to select alarm loudness.
Step 3
Turn, then push the knob to adjust the volume.
- The volume range is 1 to 5 (loudest).
- As the volume is changed, the system sounds test tones.
- Push the knob to save the change.
Show or hide alarm limits and units

To simplify the displays, hide alarm limits and units of measurement. If the alarm limits are hidden, the screen automatically shows the limits when:

- An alarm occurs.
- Volume alarms are off or the auxiliary common gas outlet is selected (monitoring off).
- An individual alarm limit is set to Off.

When the system is set to Standby, alarm limits go back to Show.

### Step 1
Select the Screen and Audio Setup menu.
- Push the menu key.
- Turn, then push the knob to select Screen and Audio Setup.
Step 2  
Turn, then push the knob to select Alarm Limits or Units of Measure.

Go to Main Menu

---

**Turn the volume alarms on or off**

⚠️ **WARNING**  
Do not turn volume alarms off with a spontaneously breathing patient, the system will not alarm for low volume.

The volume alarm key (VVE/VTE) turns volume alarms on and off. When the alarms are off, a large X covers the limits.

Use this control to prevent false alarms if you switch to manual ventilation at lower tidal volumes.

Use the End Case key (on control panel) to prevent apnea alarms between patients.
Set alarm limits

Note: If the Alarm Settings page shows \( V_e \) Auto Limits during mechanical ventilation, the system is set to automatically calculate \( V_e \) limits.

**Step 1**
Select the Alarm Settings menu.
- Push the menu key.
- Turn, then push the knob to select Alarm Settings.

**Step 2**
Turn, then push the knob to select a limit.

**Step 3**
Turn, then push the knob to change the limit.
- Push the knob to save the change.
- The screen returns to the normal display 25 seconds after the last change.
Set an audible alarm for circuit leaks

The patient circuit leak alarm is activated if less than half of the inspired volume returns through the expiratory flow sensor during mechanical ventilation. To prevent nuisance alarms from a known leak (e.g., an un-cuffed endotracheal tube), set the audio to Off. Normal volume and apnea monitoring does not change.

Note: This alarm is the first stage in detecting a circuit disconnect. The audible leak alarm cannot be turned off unless volume alarms are on, and the low $V_e$ limit is set to a value other than off.

Step 1
Select the Alarm Settings menu.
- Push the menu key.
- Turn, then push the knob to select Alarm Settings.
Set Cardiac Bypass

Set Cardiac Bypass to In Progress to prevent volume and apnea alarms when the patient is on cardio-pulmonary bypass.

When Cardiac Bypass In Progress is selected, the display shows:

- Cardiac Bypass
- Apnea Alarm Off
- Vol Alarms Off

Note: The mechanical ventilation must be off. When the mechanical ventilation is turned back on, Cardiac Bypass returns to the No Bypass setting and alarms become active.
Aespire 7900

**Step 1**
Select the Cardiac Bypass menu item:
- Push the menu key.
- Turn, then push the knob to select Cardiac Bypass In Progress.

**Step 2**
Push the knob again to return to No.
Start mechanical ventilation

⚠️ WARNING  Make sure the patient circuit is correctly assembled and the control settings are correct before you start ventilation.

This example assumes the system is on and in manual ventilation (bag) mode.

---

Step 1
Make sure the control settings are clinically appropriate.

---

Step 2
Set the ACGO switch to the circle system position.

---

Step 3
Set the Bag/Vent switch to the Vent position.

- This selects mechanical ventilation (Vent).
- If mechanical ventilation is not available, a message tells you what to do. For example:
  “To start mech vent set the Bag/Vent switch to Bag and back to Vent.”

---

Step 4
If necessary, inflate the bellows using the O₂ flush button.
Stop mechanical ventilation

Step 1
Make sure a manual circuit is set up and the APL valve setting is OK before stopping mechanical ventilation.

This valve adjusts the breathing system pressure limit during manual ventilation. The scale shows approximate pressures. Above 30 cm H₂O, you will feel clicks as the knob turns.

Step 2
Set the Bag/Vent switch to Bag position.

- This selects manual ventilation (bag) and stops the mechanical ventilation (ventilator).

Or:
Select the ACGO and mechanical ventilation will stop.
Alarms

Alarms appear at the top of the screen. The highest priority alarm is shown in Area 1, the next highest priority alarm in area 2. If all areas are used, the lowest priority alarms cycle in area 4.

<table>
<thead>
<tr>
<th>Area 1</th>
<th>Area 2</th>
<th>Area 3</th>
<th>Area 4</th>
</tr>
</thead>
<tbody>
<tr>
<td><img src="image1" alt="Area 1" /></td>
<td><img src="image2" alt="Area 2" /></td>
<td><img src="image3" alt="Area 3" /></td>
<td><img src="image4" alt="Area 4" /></td>
</tr>
</tbody>
</table>

**Alarm Tones**

Alarm tones tell you about the alarm priority:
- High Priority: 2 bursts of 5 tones, every 10 seconds, (repeat)...
- Medium Priority: 3 tones every 25 seconds, (repeat)....
- Informational: single tone.

**Alarm Silence**

- The screen shows the time remaining in the silence period.
- If you push the alarm silence key while an alarm is silenced, countdown time resets to 120 seconds:

  ![Alarm Silence](image5)

- High priority alarms always cause an audible tone and must be silenced individually.

**Alarm Suspend**

Pressing and holding the alarm silence key for one second, when no alarms are active, suspends audio tones for medium and low priority alarms for 90 seconds.

Refer to Part 2 of this manual for more information about alarms and messages.
Set the ventilation mode

Text below the waveform shows the ventilation mode:
- Pressure controlled modes supply a set pressure during inspiration.
- Volume controlled modes supply a set tidal volume.

**Step 1**
Select the Ventilation Mode.
- Push the menu key.
- Push the knob to select **Ventilation** Mode.

**Step 2**
Turn, then push the knob to change the mode. Push the knob to save the change.

Note  PSVPro is pressure supported ventilation with apnea backup.
Step 3
Set the highlighted control parameter. Each mode has one parameter that must be set (VT for Volume and SIMV, Pinspired for Pressure, and Psupport for PSVPro).

- Turn, then push the knob to set the value.
- Until a value is set, the ventilator shows “---”. If any other key is pressed at this time, a tone will sound.
Set ventilator controls

Optional features

The Aestiva 7900 can be equipped with several optional ventilation functions. References made in this manual to SIMV and PSVPro modes, are only applicable to systems equipped with these functions.

The ventilator controls present are based on the ventilation mode.

Messages appear on the screen if:

- You try to set a value the system cannot supply.
- You change a setting but do not save it: "Push knob to confirm change Turn knob to change setting".

Step 1
Push the selection key.

Step 2
A tone sounds and a box flashes around the setting.

Step 3
Turn the knob to set the value.

Step 4
Push the knob to save the setting.

Ventilator controls

Flow Trigger Level

This parameter sets the minimum flow detected by the ventilator which triggers the ventilator to deliver a mechanical breath to a spontaneously breathing patient. Only active in SIMV and PSVPro modes.
I:E  This control sets the inspiratory to expiratory ratio of mechanical breaths supplied to the patient.

**Insp. Termination Level**  This parameter sets the percentage of the peak inspiratory flow where the ventilator stops a pressure supported breath. Only active in SIMV and PSVPro modes.

**PEEP**  This control sets the positive end expiratory pressure. This is only available during mechanical ventilation, but the control can be set at any time.

⚠️ **WARNING**  Do not use a separate mechanical PEEP valve; incorrect operation and patient injury can result.

**Pinspired**  This control sets the amount of pressure delivered to the patient in each pressure controlled breath.

**Plimit**  This control sets the maximum (and sustained) airway pressures tolerated in the patient’s breathing system.
- If the high airway pressure limit is reached, inspiration stops and exhalation starts.
- The limit is an absolute value. There is no offset for PEEP pressure.

*Note: Pmax is the peak sensed airway pressure; Plimit is the airway pressure limit set with front panel controls.*

**Psupport**  This control sets the delivered pressure during pressure support ventilation. Only active in SIMV and PSVPro modes.

**Rate**  This control permits you to set the frequency of mechanical breaths delivered to the patient. It also establishes the apnea delay time in the PSVPro mode.

**Tinspired**  This control sets the time in seconds for each timed inspiration. Only active in SIMV and PSVPro modes.

**Trigger Window**  This control sets the range as a percent of the exhalation phase within which the patient may trigger the next mechanical breath. Only active in SIMV and PSVPro modes.

**VT**  This control sets the tidal volume delivered to the patient in the Volume Control and SIMV modes.

**Volume Control mode**  The figure and table below show Volume Control settings.
Pressure Control mode

The figure and table below show Pressure Control settings.

Set inspiratory pause  
(volume modes)

You can only use inspiratory pause in Volume Control or SIMV modes. In pressure modes, Inspiratory Pause displays a message “No Pause △”.

When Pause is on, the inspiratory volume stays in the patient’s lungs for the set pause time at the end of inspiration.

Pause can be set from Off to 60 percent of inspiratory time in increments of five percent. Minimum pause time is 400 ms.

Step 1
Select the Setup/Calibration menu.
- Push the menu key.
- Turn, then push the knob to select the Setup/Calibration menu.
Step 2
Turn, then push the knob to select Inspiratory Pause.

Step 3
Turn, then push the knob to change the setting. You must push the knob to save the change.
Set SIMV and PSVPro controls

The SIMV and PSVPro modes allow the user to set additional ventilator controls. The Pinspired, Rate, Tinspired, Psupport and PEEP controls can be set using the selection keys. The Plimit, Trigger Window, Flow Trigger Level, and Inspiratory Termination Level may be set through the Setup/Calibration menu.

Step 1
Select the SIMV/PSVPro Setup menu.
- Push the menu key.
- Turn, then push the knob to select Setup/Calibration.

Step 2
Push the knob to select SIMV/PSVPro Setup.

⚠️ WARNING ⚠️
Most anesthetic agents will cause patients to have reduced ventilatory responses to carbon dioxide and to hypoxemia. Therefore, triggered modes of ventilation may not produce adequate ventilation.

⚠️ WARNING ⚠️
The use of neuromuscular blocking agents will reduce the patient’s breathing response, which will interfere with triggering.
Step 3
Turn, then push the knob to select a setting.

<table>
<thead>
<tr>

</tr>
<tr>
<td>Go to Setup/Calibration Menu</td>
</tr>
</tbody>
</table>

Step 4
Turn, then push the knob to change the setting. You must push the knob to save the change.
Silence alarms

The alarm silence key silences current alarms for 120 seconds. When no alarm is active, holding down the alarm silence key for one second pre-silences low or medium priority alarms for 90 seconds. Minimum monitoring cannot be pre-silenced.

- The screen shows the time remaining in the silence period.
- Pushing the alarm silence key while an alarm is silenced will reset the countdown time to 120 seconds.
- High priority alarms always cause an audible tone and must be silenced individually.

Alarm tones identify the alarm priority:

- High Priority: 10 tones, 10 seconds pause, (repeat)....
- Medium Priority: 3 tones, 25 seconds pause, (repeat)....
- Low Priority: single tone.

Alarms appear at the top of the screen. The highest priority alarm will be shown in Area 1, the next highest priority alarm in area 2. If all areas are used, the lowest priority alarms cycle in area 4.

Note: Error mode messages may appear. Refer to 'Alarms and Troubleshooting' in Part 2 of the Operation Manual for more information.

- Minimum Monitoring: Monitoring data is available but a failure prevents mechanical ventilation.
- Minimum System Shutdown: Monitoring and ventilation are not possible.
Reading the pressure waveform (Paw)

Different points on the waveform are instantaneous values for measured pressures. The horizontal axis indicates the time scale for the rate, I:E ratio, and inspiratory pause (volume control setting). The vertical axis indicates the pressure.

Scales

The display automatically adjusts time and pressure scales to fit the control settings.

The time scale changes with the set Rate:

- 25 or less breaths per minute - time scale is 0 to 16 seconds
- 26 to 75 breaths per minutes - time scale is 0 to 8 seconds
- 76 or more breaths per minutes - time scale is 0 to 4 seconds
- On a change, existing pressure data is erased and new waveform data starts at time = 0.

The pressure scale changes with the Plimit setting:

- 12 to 40 Plimit, y-axis range is -5 to 40
- 41 to 60 Plimit, y-axis range is -5 to 60
- 61 to 100 Plimit, y-axis range is -5 to 100
- When the pressure scale changes, existing pressure data is erased and new waveform data starts at time = 0.
### Example Volume Control
- **PEEP:** Off
- Maximum sensed inspiratory pressure (Pmax): 25
- Mean positive airway pressure (Pmean): 11

**Figure 3-1 • Paw waveform in Volume Control mode**

### Example Pressure Control
- **Pmax:** 34
- Upper pressure limit (Plimit): 40
- **PEEP:** 10

**Figure 3-2 • Paw waveform in Pressure Control mode**
**Example SIMV**
- Plateau pressure (Ppl): 15
- Inspiratory time (Tinspired): 1.5
- Inspiratory Pause: 60

![Paw waveform in SIMV mode.]

**Example PSVPro**
- PEEP: 5
- Pressure support: 10
- Mean positive airway pressure (Pmean): 7

![Paw waveform in PSVPro mode.]

---

*Figure 3-3* • Paw waveform in SIMV mode.

*Figure 3-4* • Paw waveform in PSVPro mode.
Measure circuit compliance

To measure compressible volume in patient tubes:

1. Set the ventilator to volume control mode.
2. Set a tidal volume \( V_T \) of 500 mL
3. Set a rate of 10 breaths/min.
4. Set an I:E ratio of 1:1
5. Set the Plimit control to 30 cmH\(_2\)O.
6. Occlude the patient connection of the Y piece. Do not contaminate a clean patient connection.
7. Turn on mechanical ventilation.
8. Monitor the exhaled tidal volume \( V_{TE} \) and \( P_{max} \) (measured peak airway pressure).

The \( V_{TE} \) measures the gas needed to fill the patient circuit at the measured pressure.

The example shows how tubing compliance factor can be calculated.

\[
V_{TE}/(P_{max} - 2.5) = \text{Compliance factor in mL per cmH}_2\text{O}
\]

Example:

\[
P_{max} = 21 \text{ cmH}_2\text{O}
\]

\[
V_{TE} = 24 \text{ mL}
\]

\[
24/(21 - 2.5) = 1.3 \text{ mL/cmH}_2\text{O}
\]

This factor can be used to calculate the approximate gas compression in patient tubes.

For example, if the patient is requiring 30 cmH\(_2\)O to ventilate,

\[
30 \times 1.3 = 39 \text{ mL of gas is compressed in the tubes each breath. This gas (39 mL) is part of the set tidal volume but it does not reach the patient.}
\]

\(^1\) Force of the Bellows.
Show the service settings

The About Ventilator screen shows ventilator settings that can only be changed by an approved service representative.

<table>
<thead>
<tr>
<th>Item</th>
<th>Use</th>
</tr>
</thead>
<tbody>
<tr>
<td>Software Version</td>
<td>If you call for service, a representative may ask for this.</td>
</tr>
<tr>
<td>Facility defaults or last</td>
<td>Tells you if the system saves the current settings when you turn it off or goes back to facility defaults.</td>
</tr>
<tr>
<td>settings</td>
<td></td>
</tr>
<tr>
<td>Altitude</td>
<td>Used for gas calculations. If the altitude is not correct, O₂ calibration can fail.</td>
</tr>
<tr>
<td>Drive gas (O₂ or Air)</td>
<td>Tells you which gas the ventilator uses to drive the bellows. This gas comes from the same supply (pipeline or cylinder) that the anesthesia machine uses. If this gas comes from a cylinder, the cylinder empties faster than you would expect from the flowmeter settings.</td>
</tr>
</tbody>
</table>

Step 1
Select the Setup/Calibration menu.
- Push the menu key.
- Turn, then push the knob to select Setup/Calibration.
**Step 2**
Turn, then push the knob to select About Ventilator.
Measure circuit compliance

To measure compressible volume in patient tubes:

1. Set the ventilator in volume control mode.

2. Set a tidal volume \((V_t)\) of approximately 500 mL

3. Set a rate of 10 breaths/min.

5. Set the \(P_{\text{limit}}\) control to 20 cm H\(_2\)O.

6. Occlude the patient connection of the wye piece. Do not contaminate a clean patient connection.

7. Turn on mechanical ventilation.

8. Monitor the exhaled tidal volume \(V_{TE}\) and \(P_{\text{max}}\) (measured peak airway pressure).

The \(V_{TE}\) measures the gas needed to fill the patient circuit at the measured pressure.

The example shows how tubing compliance factor can be calculated.

\[
V_{TE}/(P_{\text{max}} - 2.5) \text{ cm H}_2\text{O} = \text{Compliance factor in mL per cm H}_2\text{O}
\]

Example:

\(P_{\text{max}} = 20 \text{ cm H}_2\text{O}\)

\(V_{TE} = 24 \text{ mL}\)

\[24/(20-2.5) = 1.4 \text{ mL/cm H}_2\text{O}\]

This factor can be used to calculate the approximate gas compression in patient tubes. For example, if the patient is requiring 30 cm H\(_2\)O to ventilate, 30 \(\times\) 1.4 = 42 mL of gas is compressed in the tubes each breath. This gas (42 mL) is part of the displayed tidal volume but it does not reach the patient.

\(^1\) Force of the bellows.
4 Preoperative Tests

In this section

- Aespire 7900 Preoperative tests schedules .................................................. 4-2
- Inspect the System ......................................................................................... 4-4

- Breathing system tests ............................................................................... 4-16
- Monitor and ventilator tests ....................................................................... 4-18
# Aespire 7900 Preoperative tests schedules

## Test Intervals

Do the Preoperative tests listed below at these events:

1. Every day before the first patient.
2. Before each patient.
3. When required after a maintenance or service procedure.

The following table indicates when a test must be done and gives a page number location where the test can be found.

<table>
<thead>
<tr>
<th>Test Intervals</th>

</table>
**WARNING**

Do not use this system unless you have read each component’s operation and maintenance manual and understand:

- All system connections
- All of the warnings and cautions
- How to use each system component
- How to test each system component

Before you use this system:

- Complete all of the tests in this section
- Test all other system components

If a test failure occurs, do not use the equipment. Have an approved service representative repair the equipment.

**Test devices**

The following test tools are needed for some of the tests.

<table>
<thead>
<tr>
<th>Item</th>
<th>Datex-Ohmeda Ref.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Positive pressure leak test device (BSI, 25 kPa)</td>
<td>1001-8975-000</td>

</tr>
</tbody>
</table>
Aespire 7900

**Inspect the System**

⚠️ WARNING  
 Make sure that the breathing circuit is correctly connected and not damaged.

⚠️ WARNING  
 The upper shelf weight limit is 34 kg (75 lb).

**Make sure that:**

1. The equipment is not damaged.
2. All components are correctly attached.
3. The breathing circuit is correctly connected, not damaged, and the breathing system contains sufficient absorbent.
4. The vaporizers are locked in position and contain sufficient agent.
5. Pipeline gas supplies are connected and the pressures are correct.
6. Cylinder valves are closed on models with cylinder supplies.

⚠️ WARNING  
 Do not leave gas cylinder valves open if the pipeline supply is in use. Cylinder supplies could be depleted, leaving an insufficient reserve supply in case of pipeline failure.

7. Models with cylinder supplies have a cylinder wrench attached to the system.
8. The necessary emergency equipment is available and in good condition.
9. Equipment for airway maintenance, tracheal intubation, and IV administration is available and in good condition.
10. Applicable anesthetic and emergency drugs are available.
11. If the optional O₂ flowmeter and suction regulator are present, the system O₂ and vacuum source must be connected and the system switch in the standby position:
   - The O₂ flowmeter provides adequate flow.
   - The suction regulator provides adequate suction.
12. Make sure the casters are not loose and the brake(s) is set and prevents movement.
13. Connect the power cord to a wall outlet. The mains indicator comes on when AC Power is connected.

- If the indicator is not on, the system does not have mains (electrical) power. Use a different outlet. Close the circuit breaker or replace or connect the power cable. Refer to Figure 2-2.

**Power failure alarm test**

1. Set the system switch to On.

2. Unplug the power cord with the system turned on.

3. Make sure that the power failure alarm (audio tone and “On Battery - Power OK?” message on the display) comes on.

4. Connect the power cord again.

5. Make sure the alarm cancels.

6. Set the system switch to Standby.

**Minimize alarms (optional)**

Set the ventilator controls to decrease the number of alarms:

1. Set the system switch to On.

2. Control Keys:
   - Volume alarms: Off.

3. Alarm menu:
   - Low O₂: 21%
   - High O₂: Off.

4. Bag/Vent switch:
   - Bag
Pipeline and cylinder tests

⚠️ **CAUTION** To prevent damage:

- Open the cylinder valves slowly.
- Do not force the flow controls.

If your system does not use cylinder supplies, do not do steps 2 through 12.

1. Disconnect the pipeline supplies and close all cylinder valves.
   If the pipeline and the cylinder pressure gauges are not at zero:
   - Connect an O\textsubscript{2} supply.
   - Set the system switch to On, if it is not already set.
   - Set the flow controls to mid range.
   - Make sure that all gauges but O\textsubscript{2} go to zero.
   - Disconnect the O\textsubscript{2} supply.
   - Make sure that the O\textsubscript{2} gauge goes to zero. As pressure decreases, alarms for low O\textsubscript{2} supply pressure should occur.

2. Make sure that the cylinders are full:
   - Open each cylinder valve.
   - Make sure that each cylinder has sufficient pressure. If not, close the applicable cylinder valve and install a full cylinder.

3. Test one cylinder at a time for high pressure leaks.
4. Set the system switch to Standby, which stops the O\textsubscript{2} flow.
5. Turn OFF the auxiliary O\textsubscript{2} flowmeter.
6. Turn off the suction.
7. Open the cylinder.
8. Record the cylinder pressure.
9. Close the cylinder valve.
10. Record the cylinder pressure after one minute. If the pressure decreases more than 690 kPa (100 psig) there is a leak.
• If there is a leak, install a new cylinder gasket and tighten the tee
handle as shown in “How to install gas cylinders (high pressure leak
test)” of the section ‘1 Setup and Connections’ in Part 2 of this
manual.
• Do this step again. If the leak continues, do not use the system.

11. Repeat steps 7 through 10 for all cylinders.

⚠️ CAUTION
Do not leave gas cylinder valves open if the pipeline supply is in
use. Cylinder supplies could be depleted, leaving an insufficient
reserve supply in case of pipeline failure.

13. Connect the pipeline supplies.

14. Set the system switch to On.

15. Use this chart to check pipeline pressure:

| ANSI (USA and Intl.), Australian, Canadian, French, Japanese | 345 kPa (50 psig) |
| ISO, Italian, South African, Spanish, Swiss | 414 kPa (60 psig) |
| Austrian, German | 500 kPa (75 psig) |

16. Set the system switch to Standby.

Flow control tests

⚠️ WARNING
The Link system cannot replace an O₂ monitor. Sufficient O₂ in the
fresh gas may not prevent hypoxic mixtures in the breathing
circuit.

• Nitrous oxide (N₂O), if available, flows through the system
during this test. Use a safe and approved procedure to collect
and remove it.

• Incorrect gas mixtures can cause patient injury. If the Link
system does not supply O₂ and N₂O in the correct proportions,
do not use the system.
Important

Test the O\textsubscript{2} monitor as described in Alarm tests, step 8, before continuing.

To do the flow control tests:
1. Connect the pipeline supplies or slowly open the cylinder valves.
2. Turn all flow controls fully clockwise (minimum flow).
3. Set the system switch to On.
4. Do not use the system if low battery or other ventilator failure alarms occur.
5. Make sure the O\textsubscript{2} flowtube shows approximately .025 to .075 L/min. (0.200 L/min. for single-tube variants). The other flowtubes must show no gas flow.
   - Steps 6 and 7 are only for systems with N\textsubscript{2}O.

**WARNING**

Keep the Link system engaged during steps 6 and 7:

- Adjust only the test control (N\textsubscript{2}O in step 6 and O\textsubscript{2} in step 7).
- Test the flows in sequence (N\textsubscript{2}O then O\textsubscript{2}).
- The O\textsubscript{2} sensor used in steps 6 and 7 must be correctly calibrated.

6. Test the Link 25 system with flow increasing:
   - Turn the N\textsubscript{2}O and O\textsubscript{2} flow controls fully clockwise (minimum flow).
   - Slowly turn the N\textsubscript{2}O flow control counterclockwise.
   - Make sure that the O\textsubscript{2} flow increases. The measured O\textsubscript{2} concentration must be ≥21% through the full range.

7. Test the Link 25 system with flow decreasing:
   - Set the N\textsubscript{2}O flow to 9.0 L/min.
   - Set the O\textsubscript{2} flow to 3 L/min or higher.
   - Slowly turn the O\textsubscript{2} flow control clockwise.
   - Make sure that the N\textsubscript{2}O flow decreases. The measured O\textsubscript{2} concentration must be ≥21% through the full range.

8. Adjust the flow of all gases through their full range and make sure that the flowtube floats move smoothly.

9. Disconnect the O\textsubscript{2} pipeline supply or close the O\textsubscript{2} cylinder valve.

10. Make sure that:
   - The low O\textsubscript{2} supply alarm occurs.
   - N\textsubscript{2}O, and O\textsubscript{2} flows stop. The O\textsubscript{2} flow stops last.
   - Air flow continues.
Gas supply alarms occur on the ventilator if the ventilator uses \( \text{O}_2 \) as the drive gas.

11. Turn all the flow controls fully clockwise (minimum flow).

12. Reconnect the \( \text{O}_2 \) pipeline supplies or open the \( \text{O}_2 \) cylinder valve.

13. Set the system switch to Standby.

## Vaporizer installation

**WARNING**

Use only the Selectatec series vaporizers Tec 4 or greater.

Do not use a vaporizer that lifts off the manifold when the lock lever is in the locked position.

Do not use this anesthesia system if you can turn ON more than one vaporizer at the same time.

Tec 6 Plus Vaporizers will not align correctly unless the power cable goes through the channel on the bottom of the vaporizer. Do not put the power cable on top of the manifold or between vaporizers.

1. If the top of a vaporizer is not horizontal, remove the vaporizer and reinstall it.
2. Set each vaporizer lock lever to the locked position.
3. Try to lift each vaporizer straight up off the manifold rather than pulling forward. Do not rotate the vaporizer on the manifold.
4. If a vaporizer lifts off the manifold, install it again and complete steps 1, 2, and 3. If the vaporizer lifts off a second time, do not use the system.
5. With a Tec 6 Plus Vaporizer:
   - Make sure that the vaporizer is connected to an electrical outlet.
   - Hold down the alarm silence switch for a minimum of four seconds.
   - Make sure all indicators turn on and the alarm speaker starts.
   - Release the alarm silence switch.
   - Do not continue until the operational indicator turns on. The concentration control will not turn if the operational indicator is OFF.
6. Try to turn on more than one vaporizer at the same time:
Vaporizer back pressure test

**WARNING** Anesthetic agent comes out of the common gas outlet during this test. Use a safe, approved procedure to remove and collect the agent.

**CAUTION** To prevent damage, turn the flow controls fully clockwise (minimum flow or OFF) before you turn On the system.

1. Set the system switch to on. Alarms can occur.
2. Set the $O_2$ flow to 6 L/min.
3. Make sure that the $O_2$ flow stays constant and the float moves freely.
4. Adjust the vaporizer concentration from 0 to 1% one click at a time. The $O_2$ flow must not decrease more than 1 L/min through the full range. If the $O_2$ flow decreases more than 1 L/min:
   - If $O_2$ flow decreases more than 1 L/min, then install a different vaporizer and try this step again.
   - If the $O_2$ flow decreases less than 1 L/min with a different vaporizer, the malfunction is in the first vaporizer.
   - If the $O_2$ flow also decreases more than 1 L/min with a different vaporizer, the malfunction is in the anesthesia system. Do not use the system until it is serviced.
5. Complete steps 3 and 4 for each vaporizer.
6. Set the system switch to Standby.
Low-pressure leak test

**WARNING**
Do not use a system with a low-pressure leak. Anesthetic gas will go into the atmosphere, not into the breathing circuit.

Perform either the Negative low-pressure leak test or the ISO 5358 or BSI standard positive low-pressure leak test. It is not necessary to perform both types of tests.

**Negative low-pressure leak test**

1. Set the System switch to Standby.

2. Turn on the auxiliary common gas outlet (switch in the ACGO position).

3. Test the negative pressure leak test device. (Ref. 0309-1319-800):
   - Remove all air from the bulb.
   - Put your hand on the inlet of the leak test device. Push hard for a good seal.
   - If the bulb inflates in less than 60 seconds, replace the leak test device.

4. Turn off all vaporizers.

5. Test the anesthesia machine for low-pressure leaks:
   - Turn the flow controls one and a half turns counterclockwise.
   - Connect the test device to the auxiliary gas outlet.
   - Compress and release the bulb until it is empty.
   - The vacuum causes the floats to move. This is usual. If the bulb inflates in 30 seconds or less, there is a leak in the low-pressure
circuit. Refer to the “Pneumatic problems” table in “Alarms and Troubleshooting” of Part 2 of this manual).

- Disconnect the test device.

6. Test each vaporizer for low-pressure leaks:
   - Set the vaporizer to 1%.
   - Repeat step 5. If there is a low pressure leak, refer to Part 2 of this manual.

7. Keep the test device with the system.

8. Turn all flow controls fully clockwise (minimum flow). Do not over tighten.

⚠️ WARNING ⚠️ Agent mixtures from the low-pressure leak test stay in the system. Always flush the system with O$_2$ after the low-pressure leak test (1 L/min for one minute).

⚠️ WARNING ⚠️ Turn off all vaporizers at the end of the low-pressure leak test.

9. Flush the system with O$_2$:
   - Set the system switch to on.
   - Set the O$_2$ flow to 1 L/min.
   - Continue the O$_2$ flow for one minute.
   - Turn the O$_2$ flow control fully clockwise (minimum flow).
   - Set the system switch to Standby.
ISO 5358 or BSI standard positive low-pressure leak test

⚠️ CAUTION ⚠️ Do a positive pressure leak test at the ACGO port only.

1. Connect the leak test device to the ACGO port with the positive pressure leak test adapter. Push the adapter into the ACGO port throughout the test to get a good seal.
   - Test device ref:
     1001-8976-000 (4 kPa);
     1001-8975-000 (25 kPa);
     1009-3119-000 (Adapter).

2. Turn on the auxiliary common gas outlet (switch in the ACGO position).

3. Turn all controls fully clockwise (minimum flow).

4. Fully open the needle valve on the test device.
   - Keep the test device flow tube vertical for accurate results.

⚠️ CAUTION ⚠️ If the needle valve is not fully open, this test can damage the pressure gauge on the test device.

5. Open the \( \text{O}_2 \) flow control and set a total flow of 0.4 L/min through the flowmeter on the test device.

6. Make sure that the pressure gauge on the test device reads zero and that all other flow controls are fully closed.

7. Close the needle valve on the test device until the test gauge reads:
   - BSI: 20 kPa (2.9 psi)
   - ISO 5358: 3 kPa (0.4 psi)

8. If the flow through the test device is less than 0.35 L/min (ISO) or 0.3 L/min (BSI), there is a low pressure leak in the anesthesia machine. Refer to Part 2 of this manual.
9. Repeat this low-pressure leak test for each vaporizer:
   • Set the applicable vaporizer to 1% and do steps 2 through 8.
   • Fully open the needle valve on the test device to decrease the back pressure.
   • Turn the vaporizer off.

⚠️ WARNING
Agent mixtures from the low-pressure leak test stay in the system. Always flush the system with O₂ after the low-pressure leak test (1 L/min for one minute).

Turn all vaporizers off at the end of the low-pressure leak test.

10. Remove the adapter and leak test device.

11. Flush the system with O₂:
   • Set the O₂ flow to 1 L/min and continue flow for one minute.
   • Turn the O₂ flow control fully clockwise (minimum flow).
   • Set the system switch to Standby.

### Alarm tests

1. Connect a test lung to the patient connection.
   Test device ref. 0219-7210-300.

2. Set the Bag/Vent switch to Vent.

3. Set the system to On.

4. Set the controls:

<table>
<thead>
<tr>
<th>Ventilation Mode:</th>
<th>Volume control (Select from main menu)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Ventilator:</td>
<td>Tidal Vol: 400 ml</td>
</tr>
<tr>
<td></td>
<td>Rate: 12</td>
</tr>
<tr>
<td></td>
<td>I:E Ratio: 1:2</td>
</tr>
<tr>
<td></td>
<td>P\text{\textsubscript{limit}}: 40 cm H\text{\textsubscript{2}}O</td>
</tr>
<tr>
<td></td>
<td>PEEP: Off</td>
</tr>
<tr>
<td>Anesthesia Machine:</td>
<td>O₂ flow: minimum flow (25-75 mL/min) (about 200 mL for single-tube variant)</td>
</tr>
<tr>
<td></td>
<td>All other gases: OFF</td>
</tr>
<tr>
<td></td>
<td>Push flush to fill the bellows.</td>
</tr>
</tbody>
</table>
5. Turn the Bag/Vent switch to Bag and back. Make sure that:
   - Mechanical ventilation starts.
   - A subatmospheric pressure alarm does not occur.
   - The ventilator displays the correct data.
   - The bellows inflate and deflate during mechanical ventilation.

6. Set the O₂ flow control to 5 L/min.

7. Make sure that:
   - The end expiratory pressure is approximately 0 cm H₂O.
   - The ventilator displays the correct data.
   - The bellows inflate and deflate during mechanical ventilation.

8. Test the O₂ monitor and alarms:
   - Remove the O₂ sensor and make sure the sensor measures approximately 21% O₂ in room air.
   - Set the low O₂ alarm to 50% and make sure a low O₂ alarm occurs.
   - Set the low O₂ alarm back to 21% and make sure that alarm cancels.
   - Put the O₂ sensor back in the circuit.
   - Set the High O₂ alarm to 50%.
   - Push the flush button to fill the breathing system.
   - Make sure the high O₂ alarm comes on.
   - Set the high O₂ alarm back to 100% and make sure that alarm cancels.
   - After 2 minutes in pure O₂, make sure that the sensor measures approximately 100% O₂.

9. Test the low minute volume alarm:
   - Go to the alarms menu.
   - Set the alarm limit for low minute volume to 6.0 L/min.
   - Make sure that a low minute volume alarm occurs.
   - Go to the alarms menu.
   - Set the low minute volume alarm to Off.

10. Test the high airway pressure alarm:
    - Set $P_{\text{limit}}$ to less than the peak airway pressure.
    - Make sure that the high airway pressure alarm occurs.
    - Set $P_{\text{limit}}$ back to 40.

11. Test the apnea and low airway pressure alarms:
    - Remove the test lung from the patient connection.
    - Other alarms such as low minute volume can occur.
    - Make sure that the low airway pressure and apnea alarms occur. The apnea alarm occurs after 30 seconds.

12. Test the sustained airway pressure alarm:
• Set the controls:

APL Valve: 70
Bag/Vent switch: Bag

• Mechanical ventilation stops when the Bag/Vent switch is set to Bag.
• Close the patient connection and push the O₂ Flush button.
• Make sure that the sustained pressure alarm occurs after approximately 15 seconds at the sustained pressure limit (6-30 cm H₂O varies with pressure limit).

13. Set the system to Standby.

Breathing system tests

Refer to the applicable operation manuals. At a minimum:

1. Make sure that the auxiliary equipment (humidifier, etc.) operates correctly.

2. Make sure that the check valves on the breathing circuit module work correctly:

   • The Expiratory check valve (1) rises during expiration and falls at the start of inspiration.
   • The Inspiratory check valve (2) rises during inspiration and falls at the start of expiration.
**WARNING** Objects in the breathing system can stop gas flow to the patient. This can cause injury or death:

Do not use a test plug that is small enough to fall into the breathing system.

3. Ventilator bellows test:
   - Set the system switch to Standby.
   - Set the Bag/Vent switch to Ventilator.
   - Set all flow controls to minimum.
   - Close the breathing circuit at the patient connection. Use your hand or the test plug.
   - Push the O₂ flush button to fill the bellows.
   - The pressure must not increase to more than 15 cm H₂O on the pressure gauge.
   - If the bellows falls lower than the top of the indicator, it has a leak. On a single-tube variant, the bellows should not fall at all. Refer to the troubleshooting procedure in the Part 2 of this manual.

4. Test the Bag circuit for leaks:
   - Set the system switch to On.
   - Set the Bag/Ventilator switch to Bag.
   - Plug the Bag port; use your hand or the approved test plug.
   - Close the APL valve (70 cm H₂O).
   - Set the O₂ flow to 250 mL/min.
   - Close the patient connection using a hand or test plug on the breathing system and pressurize the bag with the O₂ flush button to approximately 30 cm H₂O.
   - Release the flush button. The pressure must not decrease. A pressure decrease large enough to see on the gauge indicates a leak. Look for and repair the breathing circuit leak.

5. Test the APL valve:
   - Fully close the APL valve (70 cm H₂O).
   - Set the total fresh gas flow to approximately 3 L/min and make sure that the value on the inspiratory pressure gauge does not exceed 85 cm H₂O. Some pressure fluctuation is normal.
   - Fully open the APL valve (to the MIN position).
   - Set O₂ flow to 3 L/min. Turn any other gases off.
- Make sure that the value on the inspiratory pressure gauge is less than approximately 5 cm H₂O.
- Push the O₂ flush button. Make sure that the value on the inspiratory pressure gauge stays near zero.
- Set the O₂ flow to minimum and make sure that the value on the inspiratory pressure gauge does not decrease below 0 cm H₂O.

6. Remove your hand or the test plug from the patient connection.
7. Set the System switch to Standby.

⚠️ WARNING ⚠️ Make sure that there are no test plugs or other objects caught in the breathing system.

Monitor and ventilator tests

1. Connect a test lung to the patient connection.
2. Set the Bag/Ventilator switch to Bag.
3. Set the System switch to On.
4. Set the controls:

<table>
<thead>
<tr>
<th>Ventilation Mode:</th>
<th>Volume control (Select from main menu)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Ventilator:</td>
<td>Tidal Vol: 400 ml</td>
</tr>
<tr>
<td></td>
<td>Rate: 12</td>
</tr>
<tr>
<td></td>
<td>I:E Ratio: 1:2</td>
</tr>
<tr>
<td></td>
<td>P_limit: 40 cm H₂O</td>
</tr>
<tr>
<td></td>
<td>PEEP: Off</td>
</tr>
<tr>
<td>Anesthesia Machine:</td>
<td>O₂ flow: minimum flow)</td>
</tr>
<tr>
<td></td>
<td>All other gases: OFF</td>
</tr>
</tbody>
</table>

5. Set the Bag/Vent switch to Ventilator.
6. Push the O₂ flush button to fill the bellows.
7. Make sure that:
   - Mechanical ventilation starts.
   - A subatmospheric pressure alarm does not occur.
     Note: With active gas scavenging, too much scavenging flow can cause subatmospheric alarms.
   - The ventilator displays the correct data.
   - The bellows inflate and deflate during mechanical ventilation.
8. Set the O₂ flow control to 5 L/min.
9. Make sure that:
   - The end expiratory pressure is approximately 0 cm H₂O.
     Note: Positive end expiratory pressure when PEEP is off may indicate that the scavenging system is not removing enough gas.
• The ventilator displays the correct data.
• The bellows inflate and deflate during mechanical ventilation.

10. Set the ventilator controls and alarm limits to clinically appropriate levels.

11. If the system will not be used immediately, set the System switch to Standby and close all cylinder valves.

12. Make sure that you have:

<table>
<thead>
<tr>
<th>Equipment for:</th>
<th>Airway maintenance</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Manual ventilation</td>
</tr>
<tr>
<td></td>
<td>Tracheal intubation</td>
</tr>
<tr>
<td></td>
<td>IV administration</td>
</tr>
</tbody>
</table>

Applicable anesthetic and emergency drugs

13. Prepare the system:
• Turn all vaporizers off.
• Open the APL valve.
• Set the Bag/Ventilator switch to Bag.
• Set all flow controls to minimum.
• Set sufficient patient suction.
• Make sure that the breathing system is correctly connected and not damaged.

⚠️ WARNING Make sure that the breathing circuit is correctly connected and not damaged.

⚠️ WARNING Before you connect a patient, flush the anesthesia machine with 5 L/min of O₂ for at least one minute. This removes unwanted mixtures and by-products from the system.

Warranty

This Product is sold by Datex-Ohmeda under the warranties set forth in the following paragraphs. Such warranties are extended only with respect to the purchase of this Product directly from Datex-Ohmeda or Datex-Ohmeda’s Authorized Dealers as new merchandise and are extended to the Buyer thereof, other than for the purpose of resale.

For a period of twelve (12) months from the date of original delivery to Buyer or to Buyer’s order, but in no event for a period of more than two years from the date of original delivery by Datex-Ohmeda to a Datex-Ohmeda Authorized Dealer, this Product, other than its expendable parts, is warranted against functional defects in materials and workmanship and to conform to the description of the Product contained in this User’s Reference manual and accompanying labels and/or inserts, provided that the same is properly operated under the conditions of normal use, that regular periodic maintenance and service is performed and that replacements and repairs are made in accordance with the instructions provided. This same warranty is made for a period of thirty (30) days with respect to expendable parts. The foregoing warranties shall not apply if the Product has been repaired other than by Datex-Ohmeda or in accordance with written instructions provided by Datex-Ohmeda, or altered by anyone other than Datex-Ohmeda, or if the Product has been subject to abuse, misuse, negligence, or accident.

Datex-Ohmeda’s sole and exclusive obligation and Buyer’s sole and exclusive remedy under the above warranties is limited to repairing or replacing, free of charge, at Datex-Ohmeda’s option, a Product, which is telephonically reported to the nearest Datex-Ohmeda Customer Service Center and which, if so advised by Datex-Ohmeda, is thereafter returned with a statement of the observed deficiency, not later than seven (7) days after the expiration date of the applicable warranty, to the Datex-Ohmeda Customer Service and Distribution Center during normal business hours, transportation charges prepaid, and which, upon Datex-Ohmeda’s examination, is found not to conform with above warranties. Datex-Ohmeda shall not be otherwise liable for any damages including but not limited to incidental damages, consequential damages, or special damages.

There are no express or implied warranties which extend beyond the warranties hereinabove set forth. Datex-Ohmeda makes no warranty of merchantability or fitness for a particular purpose with respect to the product or parts thereof.
